2.3.1. Výsledky na báze základného výskumu

Názov: Optimalizácia perovskitových solárnych článkov prostredníctvom kombinovanej chemickej a štrukturálnej pasivácie
Autori: Naďa Mrkývková a kol. (APVV-21-0297)
Abstrakt: Zamerali sme sa na vývoj a porovnanie rôznych stratégií pasivácie defektov v perovskitových solárnych článkoch s cieľom zvýšiť ich účinnosť a dlhodobú stabilitu. Pre tento účel boli perovskitové vrstvy syntetizované viacerými metódami – či už pomocou bežnej mokrej depozície, alebo menej častou vákouvou depozíciou alebo aj depozíciou pomocou pulzného laseru. Skúmali sme rôzne chemické prístupy, ktoré potláčajú neradiatívnu rekombináciu a zlepšujú transport náboja. Skúmali sme vplyv draselných solí, ktoré efektívne znižujú hustotu defektov bez narušenia kryštálovej štruktúry, čo viedlo k zvýšenej fotoluminiscencii a zvýšeniu napätia naprázno (VOC). Ďalej sme realizovali dopovanie cérom ako zástupcom vzácnych zemín, ktoré zlepšilo kvantový výťažok fotoluminiscencie a zachovalo preferovanú kryštalografickú orientáciu, čím sa potvrdila možnosť cielenej úpravy optoelektronických vlastností perovskitu prostredníctvom kontrolovaného dopovania. Doplňujúco sme použili molekulovú pasiváciu pomocou tiénových katiónov, ktoré chemicky „zaceľujú“ defekty a vytvárajú stabilné 2D/3D heteroštruktúry s vyšším VOC a činiteľom plnenia (tzv. fill factor). Nakoniec sme pomocou pulznej laserovej depozície bez rozpúšťadiel pripravili orientované 2D vrstvy typu (PEA)?PbI?, ktoré poskytujú robustné rozhrania pre dlhodobú stabilitu. Tieto výsledky spoločne potvrdzujú synergický účinok kombinovanej objemovej a povrchovej pasivácie ako účinnej stratégie pre optimalizáciu perovskitových solárnych článkov.

2.3.2. Výsledky aplikačného typu

Názov: Nová metóda na posúdenie vplyvu prítomnosti defektných stavov v aktívnej vrstve na vlastnosti solárneho článku
Autori: Katarína Gmucová, Vojtech Nádaždy (VEGA -2/0165/22, APVV-22-0132)
Abstrakt: V posledných rokoch sa pozornosť materiálových vedcov v oblasti perovskitových solárnych článkov sústredila na koncept „tolerancie defektov“, ktorý označuje schopnosť materiálu udržať vysokú účinnosť aj napriek prítomnosti štruktúrnych alebo chemických defektov. Pre funkčnosť a využiteľnosť solárnych článkov v praxi je preto nevyhnutné pochopiť vplyv defektných stavov v zakázanom páse polovodiča na transport náboja, na čo sme úspešne využili nami zavedenú impedančnú spektroskopiu s energetickým rozlíšením (ER-EIS). S cieľom lepšieho pochopenia tohto vplyvu sme porovnali povrchovú a objemovú hustotu defektných stavov s tangensom strát na frekvencii, kde redoxné reakcie určujú reálnu časť impedancie. Toto porovnanie ukázalo, že heterogenita elektrónovej štruktúry naprieč tenkou vrstvou, ktorá sa prejavuje ako vyššia povrchová hustota stavov, vedie k zlyhaniu „tolerancie defektov“. Táto nami navrhnutá metóda, ktorá je rýchla a efektívna, má potenciál pri hľadaní nových materiálov s „toleranciou defektov“ a účinných technologických postupov na premenu slnečnej energie na elektrinu v praxi.
Článok v časopise Small Methods, venovaný tejto problematike, bol editormi zaradený aj do

špeciálnej virtuálnej kolekcie „Celebrating Excellence in the Advanced Materials Family: Women in Materials Science“, obsahujúcej vybrané články publikované vo viacerých časopisoch z portfólia rodín časopisov Advanced Materials a Small.

2.3.3. Výsledky na báze medzinárodnej spolupráce

Názov: The future of secure communications: device independence in quantum key distribution
Autor: Seyed Arash Ghoreishi a kol. (R4 projekt QENTAPP č. 09103-03-V04-00777)
Partneri projektu: University of Gdansk (Polsko), Masaryk University Brno (Česko), ETH Zurich (Switzerland), University of Bari (Italy), Universidad de Concepción (Chille)
Abstrakt: In the ever-evolving landscape of quantum cryptography, Device-independent Quantum Key Distribution (DI-QKD) stands out for its unique approach to ensuring security based not on the trustworthiness of the devices but on nonlocal correlations. Beginning with a contextual understanding of modern cryptographic security and the limitations of standard quantum key distribution methods, this review explores the pivotal role of nonclassicality and the challenges posed by various experimental loopholes for DI-QKD. Various protocols, security against individual, collective and coherent attacks, and the concept of self-testing are also examined, as well as the entropy accumulation theorem, and additional mathematical methods in formulating advanced security proofs. In addition, the burgeoning field of semi-device-independent models (measurement DI-QKD, Receiver DI-QKD, and One-sided DI-QKD) is also analyzed. The practical aspects are discussed through a detailed overview of experimental progress and the open challenges towards the commercial deployment in the future of secure communications.

ISMANAM 2025 – 29th International Symposium on Metastable, Amorphous and Nanostructured Materials, Bratislava, Slovensko, 140 účastníkov, 22.06.-27.06.2025
The International Symposium on Metastable, Amorphous, and Nanostructured Materials (ISMANAM) was established by Prof. Alain Reza Yavari to facilitate the exchange of knowledge on various types of metastable materials. Since its inception in 1994, ISMANAM has been held annually and served as a premier platform for sharing the latest knowledge on metastable, amorphous and nanostructured materials produced through various advanced techniques such as rapid cooling, mechanical alloying, thin-film deposition and many others. As interest in metastable materials continued to expand, ISMANAM remains at the forefront of this dynamic field, promoting cutting-edge research and facilitating connections between academia and industry. Over the years, ISMANAM has grown in both scope and participation. It has brought together leading researchers, industry experts, and emerging scientists, fostering collaboration and innovation in the field. The symposium has traveled to various notable locations all around the globe, allowing for a rich exchange of ideas and advancements in materials science. The ISMANAM 29 (2025) symposium attempts to offer a dynamic program featuring plenary, keynote and invited lectures, oral presentations and poster sessions supplemented by diverse social activities.

SURFINT-SREN IX – Progress in Applied Surface, Interface and Thin Film Science, Smolenice, Slovensko, 18.11.-20.11.2025
The main goal of the conference is to contribute to new knowledge in surface, interface, ultra-thin films and very-thin films science of inorganic and organic materials by the most rapid interactive manner - by direct communication among scientists of corresponding research fields. The list of topics indicates that conference interests cover the development of basic theoretical physical and chemical principles and performance of surfaces-, thin films-, and interface-related procedures, and corresponding experimental research on atomic scale. Topical results are applied at development of new inventive industrial equipments needed for investigation of electrical, optical, and structural properties, and other parameters of atomic-size research objects. The conference range spreads, from physical point of view, from fundamental research done on sub-atomic and quantum level to production of devices built on new physical principles. The conference topics include also presentation of principally new devices in following fields: solar cells, liquid crystal displays, high-temperature superconductivity, and sensors. During the event, special attention will be given to evaluation of scientific and technical quality of works prepared by PhD students, to deep ecological meaning of solar cell energy production, and to exhibitions of companies.

Na základe výsledkov akreditácie pokračujeme v identifikovaní slabých a silných stránok ústavu a realizujeme konkrétne aktivity prispievajúce na rozvoj ústavu.

14.2. Hlavné body Akčného plánu organizácie a stav ich plnenia

V r. 2025 sme pokračovali v napĺňaní hlavných bodov akčného plánu činnosťami:

- Prijali sme 5+2 nových PhD študentov, financovaných z rôznych zdrojov. Počty PhD študentov financovaných z centrálnych zdrojov SAV sa snažíma napĺňať na maximum, napriek zdĺhavejším administratívno-technickým problémom pri vybavovaní ich dokumentov (nostrifikácie diplomov atď.).
- Vo výberovom konaní na ústavom financovanú pozíciu „IP SAS Fellow“ uspel nový kandidát, S. Ullah nastúpil na oddelenie OMN.
- Boli odmenené publikácie s vysokým impakt faktorom a s vysokým počtom citácií na jednu publikáciu.

14.3. Aktualizácia Akčného plánu organizácie v roku 2025

V uplynulom roku bola sformulovaná nová koncepcia akčného plánu na roky 2030+40, ktorá bola prediskutovaná aj s medzinárodným poradným panelom. V r. 2026 sa očakáva jeho finálne potvrdenie. Ústav tiež pokračuje v napĺňaní cieľov výkonnostnej zmluvy o poskytnutí finančných prostriedkov na podporu vedy a výskumu v rámci Akčného plánu Národnej stratégie výskumu, vývoja a inovácií 2030. Aj v rámci monitoringu zo strany Predsedníctva SAV môžeme konštatovať, že realizované aktivity prispievajú k úspešnému naplneniu všetkých kvantitatívnych a kvalitatívnych ukazovateľov v zadefinovaných šiestich tematických okruhoch.

V roku 2025 sme pokročili v systematickej charakterizácii materiálov na báze uhlíka využitím multimodálneho spektroskopického prístupu. Použili sme nanoFTIR mapovanie na dosiahnutie chemického zobrazovania na nanometrovej úrovni. Súčasne bola implementovaná konfokálna Ramanova spektroskopia ako komplementárna metodika na vyhodnotenie štruktúrneho usporiadania a hustoty defektov uhlíkových materiálov. Integrácia týchto techník – preklenujúca medzeru medzi nano- a mikro-rozmermi – ponúka diagnostický rámec pre komplexnú analýzu foriem uhlíka v študovaných vzorkách.

Bol preskúmaný problém existencie tlmených oscilujúcich štruktúr pre efektívne elektromagnetické formfaktory deuterónu, využitím rovnakej procedúry ako v prípade protónov, napriek tomu, že neexistujú experimentálne údaje pre totálny účinný prierez e+e- -> D barD. Spoločný výsledod deuterónových, kaónových a nukleónových analýz indikuje, že zdanlivé tlmené oscilujúce štruktúry nie sú reálne a sú výsledkom veľmi zjednodušeného teoretického popisu založeného na elementárnom trojparametrovom modeli. Na druhej strane použitý unitárny a analytický model demonštruje svoje schopnosti byť aplikovaný na opis rôznych hadrónových procesov.

V rámci kovariantného kvarkového modelu bol analyzované šírky leptonického rozpadu ťažkých kvarkónií, najme B0 a B+, ako komplementárne pozorovateľné prvky k semileptonickým rozpadom ťažkých mezónov.

Boli publikované štyri publikácie a dva konferenčné príspevky. Práce zahŕňajú aj publikáciu venovanú konštrukcii aproximáciám derivácie, ktoré sa konštruujú ako mocninné rady zostavené z rôznych funkcií.

Trioxid volfrámu (WO3) je polymorf. Nízkoteplotná fáza epsilon, ktorá je v objemovom WO3 stabilná iba pri teplotách <-40°C, je sľubným aktívnym materiálom. Posun stability tejto fázy do vyšších teplôt sa dosahuje napr. mikrokryštalickou morfológiou a dopovaním. Projekt sa venoval štruktúre mikrokryštalického WO3 dopovaného chrómom. Simultánnym použitím pomocou viacerých metód (Ramanova spektroskopia, rtg difrakcia, rastrovacia a transmisná elektrónové mikroskopie) sme identifikovali charakteristické frekvencie fázy epsilon v oblasti nízkych frekvencií Ramanovho spektra, ktoré umožňujú stanoviť obsah fázy epsilon v polykryštalickom WO3.

V poslednej etape projektu v roku 2025 prebiehali pokročilé biologické experimenty – 3D sferoidové modely a in vivo testy – ktoré si vyžadovali kontinuálnu prípravu biokonjugátov MoOx?ABPA?M75. Pri ich príprave sme postupovali podľa protokolu vypracovaného v predchádzajúcej fáze riešenia projektu a fyzikálno?chemické vlastnosti konjugátov sme priebežne monitorovali. Vďaka cielene navrhnutej štruktúre sa konjugát ukázal ako mimoriadne účinný: vykazuje preferenčnú väzbu na rakovinové bunky a po aplikácii 808 nm žiarenia ich efektívne deštruuje. Na xenograftových modeloch sme po intratumorálnej injekcii pozorovali výrazné zmenšenie nádorov. Projekt sa uzavrel úspešne, s množstvom publikácií a konferenčných príspevkov, a zároveň inšpiroval vznik ďalších vedeckých spoluprác.

hľadiska ich vhodnosti na zabudovanie do hydrogelových matíc. Nanočastice MoOx sme následne zabudovávali do hydrogélov na báze kopolyméru poly(iPOx co MBL) za rôznych podmienok a vyhodnotili sme účinnosť ich integrácie do polymérnej matrice, ako aj fyzikálno chemické vlastnosti vzniknutého „trojského koňa“ pre protinádorové aplikácie.

Chalkogenidové perovskity, konkrétne BaZrS3, sa profilujú ako stabilné a netoxické alternatívy k olovnatým halogenidovým perovskitom pre fotovoltiku novej generácie. Tento projekt sa zameriava na optimalizáciu prípravy tenkých vrstiev BaZrS3 s cieľom zhodnotiť ich základné fotoelektrické vlastnosti. Využitím zjednodušenej architektúry kov-polovodič-kov ITO/BaZrS3/Ag sme skmúmali mechanizmy fotogenerácie excitónov a rýchlosti rekombinácie závislé od elektrického poľa pri rôznych hodnotách predpätia. V roku 2025 sme v spolupráci s hlavným riešiteľom uskutočnili analýzu pomocou Ramanovej spektroskopie na vrstvách deponovaných na komponentoch fúzneho zariadenia Joint European Torus (JET), ktoré sú v priamom kontakte s plazmou. Naše zistenia naznačujú, že Ramanova spektroskopia predstavuje komplementárnu metodiku k spektroskopii laserom indukovanej plazmy (LIBS). Integrácia týchto techník umožňuje komplexnejšie pochopenie chemického zloženia povrchových vrstiev, čo je kľúčové pre monitorovanie erózie materiálu vo fúznych reaktoroch.

V roku 2025 sme pokročili v systematickej charakterizácii polymérnych mikročastíc (beads) s využitím konfokálnej laserovej skenovacej mikroskopie (CLSM) a konfokálnej Ramanovej mikroskopie (CRM). Integrácia CLSM zobrazovania s vysokým rozlíšením a molekulárnej špecifickosti CRM umožňuje multidimenzionálnu analýzu vnútornej štruktúry častíc. Korelácia týchto súborov dát poskytuje kľúčové poznatky o mechanizmoch tvorby, ktoré určujú rôzne koncentračné profily. V roku 2025 sme úspešne ukončili tento projekt, pričom sme dosiahli dva kľúčové míľniky. Po prvé, zdokonalili sme metodiku operando röntgenovej difrakcie (XRD), ktorá umožňuje v reálnom čase monitorovať fázové premeny v lítium-železo-fosfátových (LFP) katódach počas elektrochemického cyklovania. Po druhé, úspešne sme implementovali technológiu atómovej depozície vrstiev (ALD) na vytvorenie konformných, ultratenkých ochranných vrstiev na LFP materiáloch. Tieto vrstvy výrazne potláčajú parazitné reakcie, čím zvyšujú cyklickú stabilitu a prevádzkovú životnosť LFP batériových systémov novej generácie.

V počiatočnej fáze projektu sme zdokonalili metodiku pre operando XRD/GEIS charakterizáciu batérií s pevným elektrolytom (SSB). Optimalizovali sme operando cely s cieľom zvýšiť priepustnosť röntgenového žiarenia pri energii 22 keV (Ag Ka), čím sme zabezpečili lepší pomer signálu k šumu pre merania v laboratórnych podmienkach. Prvotná validácia sa uskutočnila na systéme NCM/LPSCl/InLi, pričom časovo rozlíšené XRD záznamy boli porovnané s referenčnými dátami zo synchrotónu. Výsledky potvrdzujú, že v laboratórnom prostredí je možné získať vysokokvalitné štruktúrne informácie s časovým rozlíšením 300 sekúnd. Integrácia metódy operando GEIS navyše umožňuje sledovať vývoj elektrochemickej impedancie.
